

# Density Practice: Worksheet #1

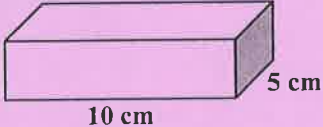

Calculate density, and identify substances using a density chart.

Density is a measure of the amount of mass in a certain volume. This physical property is often used to identify and classify substances. It is usually expressed in grams per cubic centimeters, or  $\text{g/cm}^3$ . The chart on the right lists the densities of some common materials.

Equation:  $\text{Density} = \frac{\text{mass}}{\text{Volume}}$  or  $D = \frac{m}{V}$

| Substance | Density ( $\text{g/cm}^3$ ) |
|-----------|-----------------------------|
| Gold      | 19.3                        |
| Mercury   | 13.5                        |
| Lead      | 11.4                        |
| Iron      | 7.87                        |
| Aluminum  | 3.7                         |
| Bone      | 1.7-2.0                     |
| Gasoline  | 0.66-0.69                   |
| Air (dry) | 0.00119                     |

| Problem Statement  | Formula           | Define Variables   | Substitution                                      | Answer               |
|--|-------------------|--|---|----------------------|
| <b>Sample:</b> What is the density of a billiard ball that has a volume of $100 \text{ cm}^3$ and a mass of $250 \text{ g}$ ?                      | $D = \frac{m}{V}$ | $M = 250 \text{ g}$<br>$V = 100 \text{ cm}^3$                              | $D = \frac{250 \text{ g}}{100 \text{ cm}^3}$      | $2.5 \text{ g/cm}^3$ |
| 1. A loaf of bread has a volume of $2270 \text{ cm}^3$ and a mass of $454 \text{ g}$ . What is the density of the bread?                           | $D = \frac{M}{V}$ | $m = 454 \text{ g}$<br>$V = 2270 \text{ cm}^3$                             | $D = \frac{454 \text{ g}}{2270 \text{ cm}^3}$     | $0.2 \text{ g/cm}^3$ |
| 2. A block of wood has a density of $0.6 \text{ g/cm}^3$ and a volume of $1.2 \text{ cm}^3$ . What is the mass of the block of wood?               | $M = DV$          | $D = .06 \text{ g/cm}^3$<br>$V = 1.2 \text{ cm}^3$                         | $m = .06 \times 1.2$                              | $.072 \text{ g}$     |
| 3. A $800 \text{ g}$ boulder has a density of $8 \text{ g/cm}^3$ . What is the volume of the boulder?  | $V = \frac{M}{D}$ | $m = 800 \text{ g}$<br>$D = 8 \text{ g/cm}^3$                              | $V = \frac{800 \text{ g}}{8 \text{ g/cm}^3}$      | $100 \text{ cm}^3$   |
| 4. What is the mass of the block of iron illustrated below?<br> | $M = DV$          | $V = 2 \times 10 \times 5 = 100 \text{ cm}^3$<br>$D = 7.87 \text{ g/cm}^3$ | $M = 100 \text{ cm}^3 \times 7.87 \text{ g/cm}^3$ | $787 \text{ g}$      |

Use the data below to calculate the density of each unknown substance. Then use the density chart above to determine the identity of each substance.

| Mass (g) | Volume ( $\text{cm}^3$ ) | $D = m/v$<br>Variable Substitutions | Density ( $\text{g/cm}^3$ ) | Substance |
|----------|--------------------------|-------------------------------------|-----------------------------|-----------|
| 4725     | 350                      | $D = \frac{4725}{350}$              | $D = 13.5$                  | Mercury   |
| 171      | 15                       | $D = \frac{171}{15}$                | $D = 11.4$                  | lead      |
| 148      | 40                       | $D = \frac{148}{40}$                | $D = 3.7$                   | aluminum  |
| 475      | 250                      | $D = \frac{475}{250}$               | $D = 1.9$                   | bone      |
| 680      | 1000                     | $D = \frac{680}{1000}$              | $D = .680$                  | gasoline  |
